SLEEP, HEALTH & PRODUCTIVITY

A data-driven view of how rest, wellness & performance connect

This dashboard analyzes lifestyle data from **1,000 individuals** across eight occupations to understand how sleep habits, physical health and daily routines shape workplace productivity. It brings together sleep patterns, BMI and exercise trends, mood and stress signals, and performance scores into one connected view — helping identify **what actually drives energy, wellbeing and output**, and where small changes could have the biggest impact.

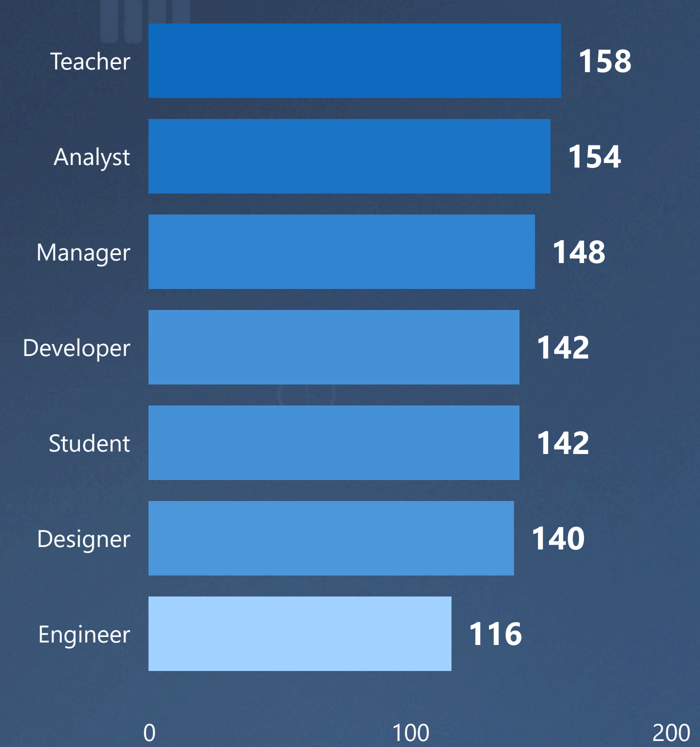
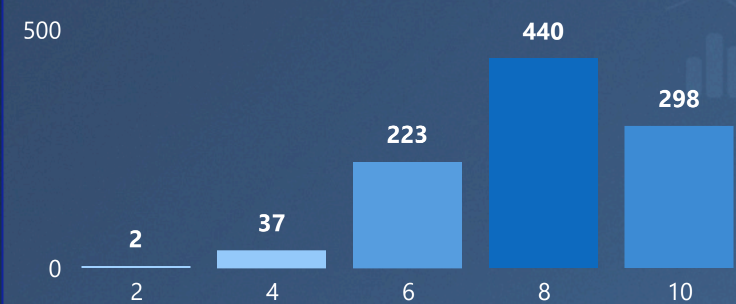
Total members	Avg Wakeup Time	Avg sleep duration	Avg Sleep_Disorder	Avg productivity Score	Avg Energy level

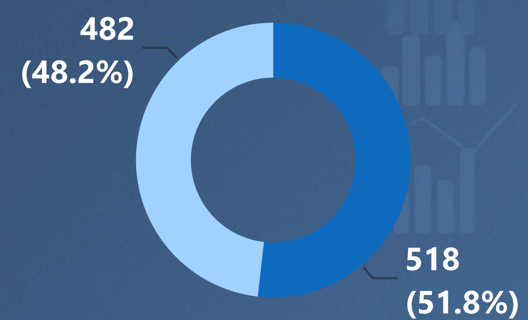
Occupation Distribution



Sleep_Quality Distribution



Gender Distribution



Key Insights

- Average sleep duration is **7 hours**, but energy levels remain very low (**7%**)
- Productivity is high at **76%**, even with low energy levels
- Sleep disorder score is **1.28**, showing mild-to-moderate risk
- Mid-range sleep quality users (6–8) still form a large group needing improvement
- Workforce is balanced, with Teachers (**158**) and Analysts (**154**) leading

Recommendations

- Maintain consistent sleep schedule (target 7–8 hours daily) for better recovery
- Reduce sleep disorder risk using stress control & reduced screen time before bed
- Investigate low energy (**7%**) despite high productivity (**76%**) — possible burnout
- Improve mid-range sleepers (6–8 score) to shift them into high-quality sleep group
- Focus wellness programs on high population groups like Teachers & Analysts

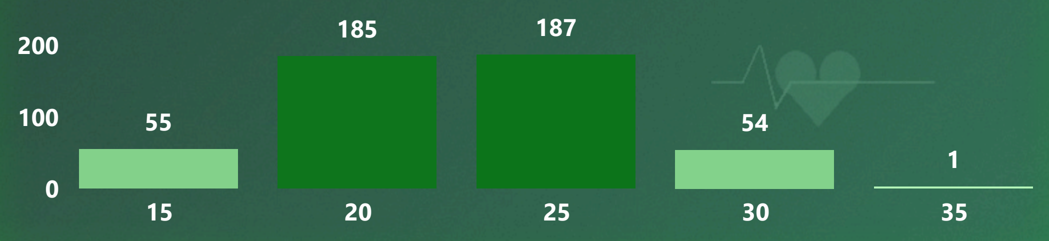
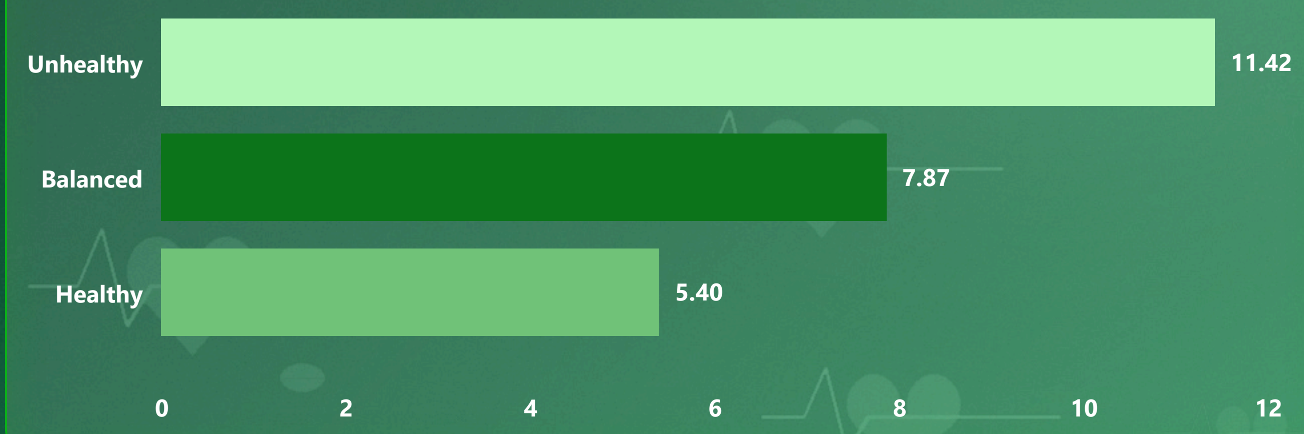
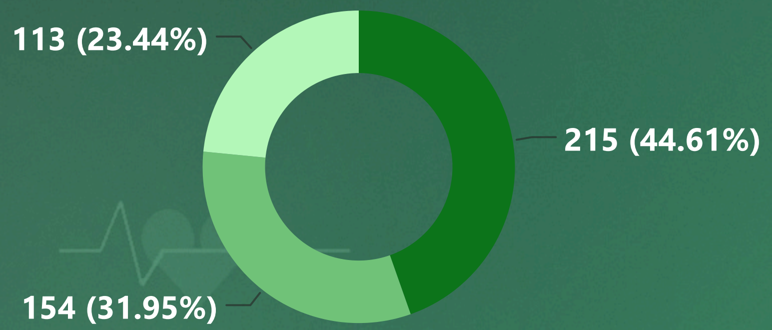
BMI Distribution



Overall Risk



Sleep_Duration_Hours by Occupation



🔍 Key Insights

🍏 311 participants follow a healthy diet
🏃 Average exercise frequency: 3.61
⚖️ Average BMI: 25.06 (Overweight Range)
❤️ Healthy diet, regular exercise & proper sleep lower health risks

💡 Recommendations

- ✅ Exercise regularly
- ✅ Maintain a balanced diet
- ✅ Monitor BMI and health risks

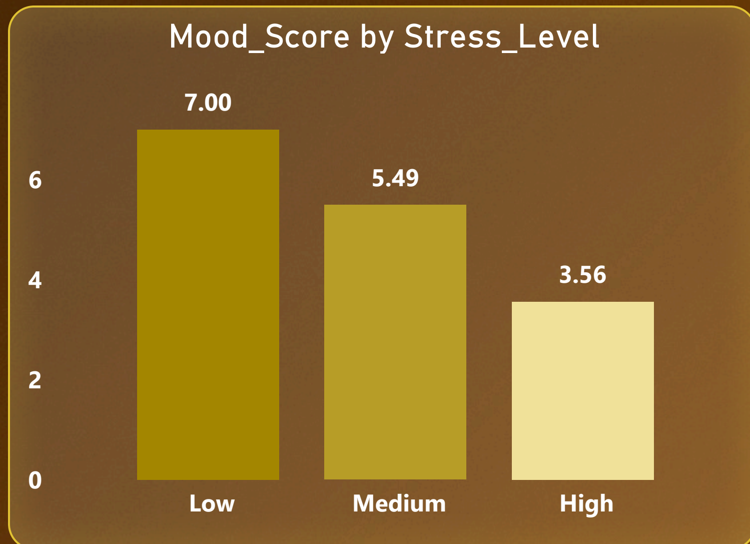
Age Group: All

0.52
Sleep Correlation

-0.45
Mood Correlation



🔍 Key Insights

🛌 **Sleep correlation: 0.52** (Moderate positive impact on productivity)

😊 **Mood correlation: -0.45** (Higher mood, lower stress)

📈 Productivity rises with **7–10 hours** of sleep

- ⚡ Sleep & mood are key performance drivers

💡 Recommendations

- ✅ **Reduce stress levels**
- ✅ **Improve sleep quality**
- ✅ **Track sleep, mood & productivity together**

05 RECOMMENDATIONS

Turning the findings from all four modules into action

Across **1,000 employees**, sleep, health and mood consistently move together with productivity: sleep has a **0.52 correlation** with performance while stress and mood show a **-0.45 correlation**, and productivity keeps climbing through **7–10 hours** of sleep. Yet average energy sits at just **7%** despite **76% productivity**, and nearly **1 in 5** people carry a medium-to-high sleep disorder risk — the clearest sign that current output is being sustained by effort, not by rest.

Protect sleep hours

Encourage a consistent 7–8 hour sleep window and a fixed wind-down time, especially for the mid-range sleepers (quality score 6–8) who make up the largest single group.

Sleep Analysis

Address disorder risk

Screen the ~20% at medium-to-high risk early. Pair this with stress-reduction support and reduced pre-bed screen time to lower long-term health exposure.

Health Analysis

Support diet & activity

Average BMI sits at 25 (overweight range) with exercise frequency near 3.6/week. Promote balanced diet programs and light, regular activity across all occupations.

Health Analysis

Investigate the burnout signal

High productivity paired with 7% average energy suggests output is being sustained by strain, not capacity. Track energy alongside output, not output alone.

Executive Overview

Where to focus first

- Teachers & Analysts — largest workforce groups, highest reach per program
- Mid-range sleepers (score 6–8, 440 people) — closest to shifting into the high-quality group
- Medium/high sleep-disorder-risk group (198 people, 19.8%) — priority for early screening
- High-stress segment — lowest mood score (3.56) and clearest lever on productivity

Keep tracking together

Sleep, mood and productivity move as one system in this data. Reviewing them side by side — not in isolation — is the fastest way to catch early drops in wellbeing before they show up in performance.
